

College of Dentistry Launches First Phase of Clinical Attachment Program

The College of Dentistry has taken a significant step towards enhancing the clinical competency of its graduates by launching the first phase of its **Clinical Attachment Program**. The initiative, held on October 6, 2024, aims to bridge the gap between theoretical knowledge and hands-on practice, ensuring graduates are fully prepared for professional careers in dentistry.

The event, conducted in person, was attended by 17 graduates, who received structured training sessions focusing on best practices in clinical settings. Practical demonstrations, interactive discussions, and mentorship from experienced faculty members played a crucial role in enriching the participants' learning experience. The goal was to elevate the clinical proficiency of graduates, ultimately leading to improved patient care standards.

During the event, participants were introduced to the structure and objectives of the attachment program. The sessions covered essential clinical procedures and emphasized professional readiness. Graduates benefited from expert guidance, which is expected to boost their confidence in real-world dental practice.

The launch of this program marks an important milestone in the college's ongoing commitment to improving graduate education and training. Future phases of the initiative will further build on this foundation, reinforcing the institution's dedication to excellence in dental education and practice.
